# 1 - Message from Carbon Neutral Britain™

It has never been more important for businesses to step up and take account of the environmental impact associated with their operations.

"We are delighted to continue our partnership with 2D Building Contractors Ltd to help identify and offset their environmental impact for 2024 and beyond."

**James Poynter**  
Director - Carbon Neutral Britain

---

In the UK, businesses account for up to 85% of total GHG emissions - making corporate action the number one priority in helping stop climate change.

Looking to do their part for the environment, 2D Building Contractors Ltd engaged with Carbon Neutral Britain in September 2025, with the ambition to measure and offset the total organisation emissions - to continue their Carbon Neutral status.

As a company that specialises in building and construction contract work, it was identified that the main emissions were to occur from the mileage completed by company owned or leased vehicles within the reporting period.

---

"IPCC studies have highlighted the importance of businesses making a difference in the next 5 years, before changes to the climate are irreversible. By Measuring, Reducing, Carbon Offsetting, and becoming Carbon Neutral - organisations are proactively doing their part for the planet now - when it is the most important."

# 2 - Carbon Emissions Summary

<b>Organisation</b>	2D Building Contractors Ltd
<b>Reporting Period</b>	1st November 2024 - 31st October 2025
<b>Consolidation Approach</b>	Operational Control
<b>First (Baseline) Year</b>	2021/22 - 136.01 Tonnes of Carbon Dioxide Equivalent
<b>Second Year</b>	2022/23 - 145.43 Tonnes of Carbon Dioxide Equivalent
<b>Third Year</b>	2023/24 - 159.17 Tonnes of Carbon Dioxide Equivalent
<b>Current Year</b>	2024/25 - 170.61 Tonnes of Carbon Dioxide Equivalent

## 2.1 Emissions Table

<b>Scope 1:</b>		
Stationary or Mobile Combustion Source	1,528.00	kg CO2e
Mains Gas	-	kg CO2e
Company Owned/Leased Vehicles	128,724.33	kg CO2e
Refrigerant Gas Loss Recharge	-	kg CO2e
Total	130,252.33	kg CO2e
<b>Total (Tonnes)</b>	<b>130.25</b>	<b>t CO2e</b>
<b>Scope 2:</b>		
Total Organisation Energy Usage on Site	2,620.84	kg CO2e
Total Electric Vehicle Energy Usage	-	kg CO2e
Total	2,620.84	kg CO2e
<b>Total (Tonnes)</b>	<b>2.62</b>	<b>t CO2e</b>

### Scope 3:

c7	Total Organisation Energy Usage WFH	-	kg CO2e
c5	Organisation Waste	302.99	kg CO2e
c6	Business Travel (not using owned/leased Vehicles)	2,443.03	kg CO2e
c7	Staff Commuting (not using owned/leased Vehicles)	867.29	kg CO2e
c6	Business Hotel or Event Activities	931.50	kg CO2e
c1/5	Organisation Water Usage	190.14	kg CO2e
c3	Transmission & Distribution Losses	274.37	kg CO2e
c3	Well to Tank	32,726.05	kg CO2e
	Total	37,735.38	kg CO2e
	<b>Total (tonnes)</b>	<b>37.74</b>	<b>t CO2e</b>

### Total

<b>Total Organisation Emissions</b>	<b>170.61</b>	<b>t CO2e</b>
-------------------------------------	---------------	---------------

# 3 - Context

## 3.1 The purpose of this report

---

This Carbon Emission Report will measure and calculate the total Greenhouse Gas (GHG) Emissions produced directly and indirectly from the organisations activities. Compulsory for Large Organisations as part of their Streamlined Energy and Carbon Reporting (SECR), HM Government encourages all organisations to take action and measure their emissions on a voluntary basis - as the most effective tool in monitoring and reducing an organisations climate impact.

GHG Emission (also referred to as Carbon Footprint) Calculation, Offsetting and Reducing are now the most popular method for businesses to make an environmental impact as part of their Corporate Social Responsibility policies due to the accurate and measured methodologies, providing complete transparency about their climate impact and resulting actions. Annual emissions reports are regularly used by organisations to track their progress in achieving emissions reductions across the business over time, and in many cases helps identify areas within the business that produce the most emissions - as an area to focus and improve.

Most importantly of all, carbon emission reports also help identify an organisations total carbon footprint - measured in tonnes of carbon dioxide equivalent (tCO<sub>2</sub>e), a set unit to ensure carbon offsetting is accurate, and will reverse the organisations environmental impact to achieve carbon neutral status - increasingly important for customers, shareholders, employees and other stakeholders.

## 3.2 The Kyoto Protocol Greenhouse Gases (GHGs)

Seven Greenhouse Gases are calculated as part this emissions report, known as the seven Kyoto Protocol GHGs. These gasses occur the most often as a result of business activities, with the highest Global Warming Potential. For the purposes of emissions reporting, these gases are simplified and measured in the unit of tonnes of carbon dioxide equivalent (tCO<sub>2</sub>e). The Global Warming Potential (GWP) of these gases are not the same however, which creates the unit equivalence compared to carbon dioxide over a period of 100 years (shown below). The latest AR6 values are included below.

GHG	Formula	GWP (CO <sub>2</sub> e)
Carbon Dioxide	CO <sub>2</sub>	1
Methane	CH <sub>4</sub>	27
Nitrous Oxide	N <sub>2</sub> O	273
Hydro fluorocarbons	HFCs	Dependant on specific gas
Sulphur hexafluoride	SF <sub>6</sub>	24,300
Perfluorinated compounds	PFCs	Dependant on specific gas
Nitrogen trifluoride	NF <sub>3</sub>	17,400

---

## 3.3 Calculating Emissions & Emissions Factors

The emissions calculations have been made using client-supplied activity data, with assumed full disclosure of all relevant and necessary information. The data received (such as energy usage in Kwh, or vehicle mileage) are then multiplied by the relevant emissions factors from published and reputable sources. Depending on the needs of the organisation, the emissions factors used in some cases are scientific research journals or independent studies, but in most cases, are from HM Government publications. Most commonly used - UK Government Conversion Factors for Company Reporting (Year: 2024, Expiry: 10/06/2025, Version 1.1) or (Year: 2025, Expiry 10/06/2026, Version 1.0) - DBEIS / DEFRA). Any assumptions or estimations of relevant data are published within this report.

---

## 3.4 Reporting Standards

GHG emissions reports are most widely carried out in accordance with the ISO 14064:1-2018 and GHG Emissions Protocol Accounting and Reporting Standards, whose methodologies have been used in the creation of this report.

The International Organisation of Standardisation (ISO) created the ISO 14064 standard in 2006, updating in 2018 to specify the principles and requirements at the organisational level for the quantification and reporting of greenhouse gas (GHG) emissions and removals. It includes requirements for the design, development, management, reporting and verification of an organization's GHG inventory.

The "Greenhouse Gas Protocol - Corporate Accounting and Reporting Standard" (GHG Protocol, 2011) developed in a partnership of the World Business Council for Sustainable Development (WBCSD) and the World Resource Institute (WRI) follow a similar methodology mirroring those of the ISO standard.

Using the two most widely recognised and used emission standards in the world, ensure all measurements, calculations and subsequent offsetting are completed to the most regulated and accurate standards possible.

## 3.5 Scopes of Emissions

Using the ISO 14064 and GHG Emissions Protocol Standards, business emissions are identified using three scopes of emissions:

### Scope 1 (Direct emissions)

Activities owned or controlled by the organisation that release emissions straight into the atmosphere.

For manufacturing business these would be emissions from equipment and machinery used in production. Businesses that own or lease vehicles are also included within scope 1. For many office-based businesses, scope 1 emissions are usually very small.

### Scope 2 (Energy indirect)

Emissions being released into the atmosphere associated with the consumption of purchased electricity, heat, steam and cooling. These are indirect emissions that are a consequence of the organisation's activities - but occur at sources that the business does not own or control.

These emissions would be the energy usage by the organisation and staff working at sites under the operational control of the business.

### Scope 3 (Other indirect)

Emissions that are a consequence of business activity, which occur at sources which are not owned or controlled, which are not classed as scope 2 emissions.

Scope 3 emissions can be quite broad, including areas such as waste management, business travel, staff commuting, events, the emissions produced from delivery to and from the organisation (including third party delivery services), transmission and distribution losses associated with electricity usage, and well to tank emissions from fuel combustion.

---

## 3.6 Radiative Forcing

Radiative forcing (RF) is a measure of the additional environmental impact of aviation. These include emissions of nitrous oxides and water vapour when emitted at high altitude.

HM Government guidance recommends organisations should include the influence of radiative forcing RF in air travel emissions to capture the maximum climate impact of their travel habits. As such, radiative forcing has been included within the emission factor calculations of air travel within this report and future reports, where applicable.

---

## 3.7 Quality and Accuracy

The accuracy of a GHG assessment is directly related to the quality of the activity data provided, and for this assessment and report, 'primary data' (such as electrical usage in Kwh for the reporting period), have been used wherever possible. 'Secondary data' in the form of estimates, extrapolations and/or industry averages has been used when primary data is not available - to provide as accurate estimates of emissions as possible.

In addition, this report has been completed following the WRI GHG Protocol principles of relevance, completeness, consistency, transparency and accuracy.

# 4 - Methodology

## 4.1 Business Introduction

---

Carbon Neutral Britain was engaged by 2D Building Contractors Ltd in order to measure and calculate the organisation's total carbon footprint for 2024/25, with the purpose of offsetting their total organisation emissions - to continue their Carbon Neutral status. As a company that specialises in building and construction contract work, it was identified that the main emissions were to occur from the mileage completed by company owned or leased vehicles within the reporting period.

## 4.2 Operational Boundary and Data

Using the operational control consolidation approach was determined as the best method for 2D Building Contractors Ltd, due to the standard business structure and business practices. As a result, the following scope of data was collected.

**Scope 1** - Stationary and Mobile Source Emissions (equipment and quantity combusted), Company Owned and Leased Vehicles (vehicle type and distance travelled), Refrigerant Gas Losses (refrigerant type and new/disposed units) for the organisation only.

**Scope 2** - Purchased Energy (electricity, imported heat, steam in kwh) from the office and vehicles, using the location based method.

**Scope 3** - Homeworking Energy (Days), Water (consumption and waste volume), Waste (landfill, recycled and composted weight), Business Travel (type and distance), Staff Commuting (average distance and type), Hotel Stays (UK, Europe or Worldwide days), Transmission and Distribution losses associated with electricity usage (kwh) and Well To Tank emissions from combustion fuels (volume combusted).

---

## 4.3 Organisation Structure

---

For organisations with a group structure, business activity data may overlap, and all relevant entities are included within this assessment. The companies considered in this assessment are:

2D Building Contractors Ltd

---

## 4.4 Assumptions and Estimations

---

Where primary emissions data could not be collected, the following assumptions and estimations were used:

- Vehicle emissions were calculated using DEFRA vehicle categories and HM Government Emission Factors (2024/25).
- Transmission and distribution losses associated with electricity usage, as well as 'Well to tank' emissions from combustion fuels were included in the assessment.
- Any incidental emissions less than 1% from the sources measured were not included within this report.
- Water consumption figures were estimated for the organisation.
- Water waste figures were estimated based on water consumption data.

# 5 - Results

## 5.1 Summary

### 2D Building Contractors Ltd Carbon (GHG) Emissions

Reporting Period - 01/11/24 - 31/10/25

**130.25**

Scope 1  
Direct Emissions

**2.62**

Scope 2  
Energy Indirect

**37.74**

Scope 3  
Indirect Other

Total  
Carbon  
Footprint

**170.61 tCO<sub>2</sub>e**

GHG Emissions 2024/25 - 170.61 tCO<sub>2</sub>e

GHG Emissions per FTE - 4.87 tCO<sub>2</sub>e

GHG Emissions per £1m - 21.33 tCO<sub>2</sub>e

Completed November 2025

# 5.2 Emissions by Scope

**130.25**  
Scope 1  
Direct Emissions

The main Scope 1 emissions occurred from the use of company owned/leased vehicles within the reporting period. Other emissions originated from stationary or mobile combustion sources.

**2.62**  
Scope 2  
Energy Indirect

The main Scope 2 emissions occurred from the company's energy usage on site. No other emissions sources were declared during the reporting period.

**37.74**  
Scope 3  
Indirect Other

The main Scope 3 emissions occurred from well to tank emissions. Other emissions occurred from waste, business travel, business hotel stays, staff commuting, water usage, and transmission and distribution losses.

# 6 - Carbon Neutral Certification

## 6.1 Carbon Neutral Status

In November 2025, 2D Building Contractors Ltd offset their carbon footprint to become certified as a Carbon Neutral Business by Carbon Neutral Britain.

As certification awarded by an external organisation, it provides assurance that the carbon neutral claim is robust and credible, following calculation using the ISO 14064 and GHG Protocol Emissions Standard principles of relevance, completeness, consistency, transparency and accuracy.

Carbon Neutral Status has been awarded to the organisation for a period of 12 months.

It is recommended the organisation completes an annual calculation of its environmental impact and emissions from 2025, to further monitor and evaluate emissions changes after implementing reduction strategies, in addition to offsetting and maintaining carbon neutral status.

## 6.2 Carbon Offsetting Projects

Through the Carbon Neutral Britain Climate Fund™, 2D Building Contractors Ltd has offset its total carbon emissions through internationally certified carbon offsetting projects.

Certified via the Verra - Verified Carbon Standard (VCS), the Gold Standard - Voluntary Emission Reductions (VER) or the United Nations - Certified Emission Reductions (CER) programmes, the projects have also been selected based on their direct and indirect impact around the world - not just in offsetting, but also in supporting education, employment and clean water, as well as having net positive impact on the local wildlife and ecology.

As the three largest and most regulated voluntary offsetting standards used by organisations and even countries in their emissions reductions - all measurements and tonnes of CO<sub>2</sub>e offset are accurate and verified.

An example of projects supported include:

Project 2151: Household Solar Lighting in Zambia

Project 3229 : Methane Capture & Power Generation

Project 3029: Wind Power in Maharashtra

Project 1165: Salkhit Wind Farm in Mongolia

Selected by Carbon Neutral Britain based upon the significant social benefits - this project provides solar lighting to families in Zambia who lack access to electricity in the home. By providing cost-effective and clean lighting solutions for the first time, families and children are able to study, cook, and socialise in the safety of the home. Carbon emissions are avoided via households previously being dependent on inefficient and high carbon output lighting from kerosene lamps and fireplaces, which are replaced by the solar lighting devices provided.

For more information & images of this project, please refer to your Media Pack, issued upon completion of your Business Offsetting & Carbon Neutral Certification. Images and copy subject to CNB Brand Guidelines use only.

Selected by Carbon Neutral Britain, Project 3029 - Wind Power in Maharashtra - produces renewable electric power from 17, 1500kW capacity wind electric generators (WEGs), in a region where fossil fuels would have otherwise been burnt for energy. This project involves the construction, commissioning, and safe operation of a wind farm in the Indian state of Maharashtra, supplying the state electricity grid, which forms a part of the Western Regional Electricity Grid of India. In addition to providing clean energy, the significant secondary benefits of the project are to provide Social, Environmental, Economic, and Technical benefits within the region.

For more information & images of this project, please refer to your Media Pack, issued upon completion of your Business Offsetting & Carbon Neutral Certification. Images and copy subject to CNB Brand Guidelines use only.

Selected by Carbon Neutral Britain - Salkhit Wind Farm is the first grid-connected wind farm in Mongolia. The project generates renewable electricity using wind power turbines, and supplies the Mongolian central grid to meet the growing electricity demand within the region. As the first wind farm in Mongolia - the significant benefits of its development are to help increase technical knowledge and expertise for future renewable development across the country.

For more information & images of this project, please refer to your Media Pack, issued upon completion of your Business Offsetting & Carbon Neutral Certification. Images and copy subject to CNB Brand Guidelines use only.

Project 3229 showcases a prime example of circular and sustainable agriculture in the Netherlands. Located across the most southerly regions of the country, a collective of 30 Dutch farmers are able to capture methane from manure via biogas plants funded through offsetting climate finance. The project not only reduces emissions of this potent greenhouse gas through storage, but also avoids the use of fossil fuels and generates green electricity. As a fully circular process: residual heat is utilized, and the by-product after fermentation is then used as an alternative to chemical fertilizers for plant nutrition.

For more information & images of this project, please refer to your Media Pack, issued upon completion of your Business Offsetting & Carbon Neutral Certification. Images and copy subject to CNB Brand Guidelines use only.

# 6.3 Project Quality - Independent Project Validation and Assurance

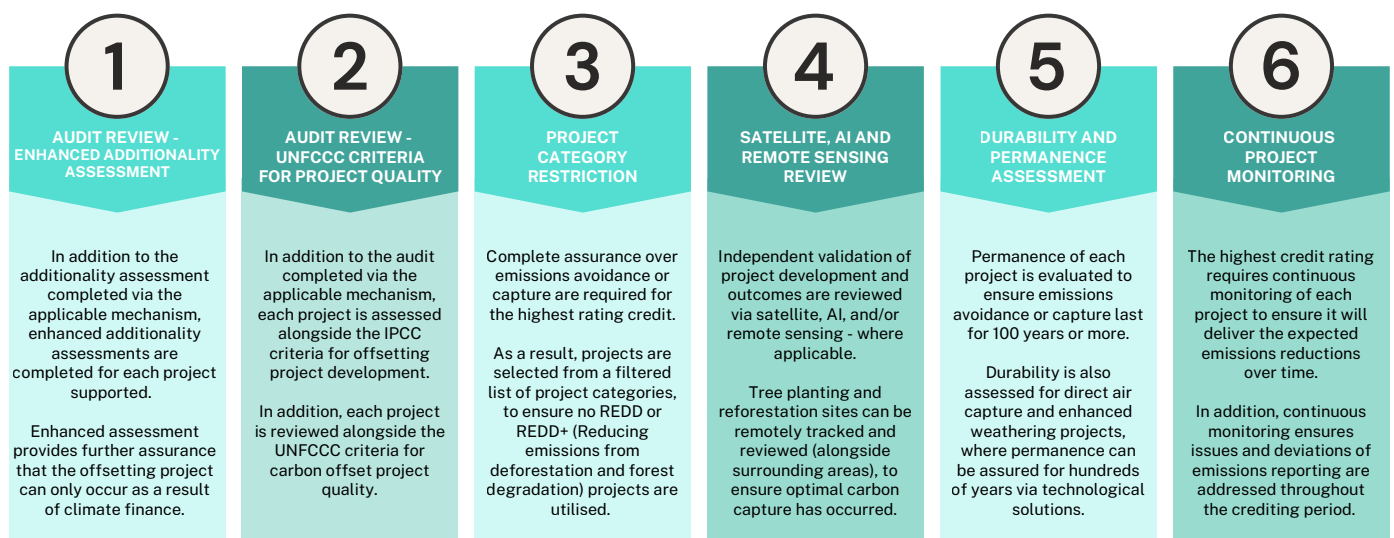

Following our mission to provide the Best Value, Biggest Impact, Most Transparency, and Upmost Quality and Assurance in Carbon Offsetting, above and beyond the requirements of the United Nations CER, Verra, and Gold Standard Mechanisms, Carbon Neutral Britain also completes Independent Project Validation and Assurance of each project supported to ensure the highest quality of Carbon Offsetting.

Validation and assurance of each project is achieved via three layers of assessment.

**First** - all projects utilised must be audited and approved via the United Nations CER, Verra, or Gold Standard Mechanisms. As the three largest and most regulated carbon offsetting standards in the world - this ensures the measurements and tonnes of CO2e offset are accurate and verified by these third parties (with public audits available for each project).

**Second** - Carbon Neutral Britain selects projects based on the 'secondary' benefits, such as helping to provide education, employment, clean water, energy, or have a positive impact on the local wildlife and ecology (for nature-based projects). Carbon Neutral Britain ensures all projects align with United Nations Sustainable Development Goals - with details available for each project.

**Third** - all projects are Independently Validated, completing due diligence on the audits completed via the applicable corporate standard. This is achieved via successful completion of the 6 steps below.

---

# 7 - Carbon Reduction Plan (CRP)

## 7.1 Reduction Overview

---

IPCC studies (and COP discussions) have highlighted the importance of businesses making a difference in the next 5 years before changes to the climate are irreversible, and by Carbon Offsetting and becoming Carbon Neutral, 2D Building Contractors Ltd is proactively doing its part for the planet now - when it is the most important.

In addition to Carbon Offsetting and Carbon Neutral status - it is recommended that 2D Building Contractors Ltd takes further action to reduce its future emissions - as much as practically possible. By reducing all avoidable emissions to zero - the organisation will achieve Net Zero status.

---

## 7.2 Science Based Targets

As part of the 2015 Paris Agreement, world governments committed to curbing global temperature rise to well-below 2°C above pre-industrial levels, and pursuing efforts to limit warming to 1.5°C. In 2018, the IPCC warned that global warming must not exceed 1.5°C to avoid the catastrophic impacts of climate change.

It was agreed that to achieve this, GHG emissions must halve by 2030 – and drop to Net Zero by 2050. In order to align with these Science Based Targets - 2D Building Contractors Ltd must commit to reducing half of its GHG emissions by 2030 and to achieving Net Zero by 2050.

---

## 7.3 Procurement Policy Note 06/21

---

The UK Government amended the Climate Change Act 2008 in 2019 by introducing a target of at least a 100% reduction in the net UK carbon account (i.e. reduction of greenhouse gas emissions, compared to 1990 levels) by 2050. This is otherwise known as the ‘Net Zero’ target.

To aid in this target, UK suppliers to government contracts are required to meet the requirements of Procurement Policy Note (PPN) 06/21, by providing a Net Zero Carbon Reduction Plan.

In addition to calculating Scope 1, 2 and a subset of Scope 3 emissions in tCO<sub>2</sub>e for the six greenhouse gases covered by the Kyoto Protocol (as outlined in this report), 2D Building Contractors Ltd is required to make a commitment to achieving net zero by 2050, outline its reduction plans, and publish its Carbon Reduction Plan (CRP) on its website.

## 7.4 Company Rebaselining Procedure

---

Meaningful and accurate comparisons of year-on-year emissions data may require a ‘rebaselining’ of emissions to the earliest reporting period where the overall structure and size of the organisation is most similar to the present.

While net emissions tell a part of the story, tracking progress in terms of emissions both per FTE and per £1m revenue can provide more granular insights for reductions.

Rebaselining is an important part of becoming Carbon Neutral, and combining this with FTE and revenue data ensures growth and changes in the nature of an organisation can be properly accounted for.

In line with relevant guidance, 2D Building Contractors Ltd’s current baseline is in line with its first reporting period (1<sup>st</sup> November 2021 - 31<sup>st</sup> October 2022), undertaken in 2022.

To track progress against this baseline, emissions per FTE and per £1m revenue since the first year of calculation have also been included within this report.

By taking this approach, 2D Building Contractors Ltd can accurately and transparently work towards Carbon Neutrality by 2030 via the globally recognised net-emissions approach, whilst also tracking progress against all available calculation years. Through this, 2D Building Contractors Ltd can generate valuable insights to target key emissions hotspots and achieve meaningful reductions.

# 7.5 Reduction Target Plan

In order to achieve a 50% reduction in emissions by 2030, 2D Building Contractors Ltd is required to reduce its emissions by **68.01 tCO2e** from the 'Baseline' (first year) assessment by 2030.

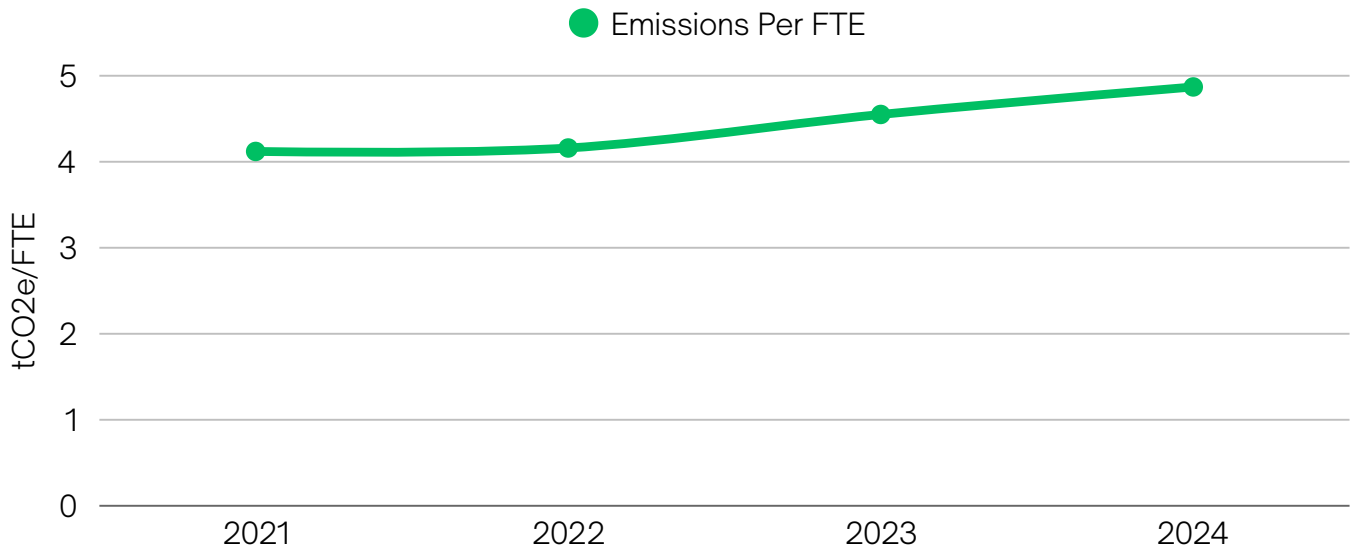

This will require a reduction of **5.55%** (7.55 tCO2e) per year from the 'Baseline' (first year) assessment of the organisation. A further reduction of **2.50%** (3.40 tCO2e) each year is then required in order to achieve Net Zero.

Should significant changes to the business size and structure occur in the future - Carbon Neutral Britain will amend the 'baseline' assessment year, as well as look at intensity values (tCO2e per million turnover, FTE or other metrics), to further track and implement reduction strategies.

"By accurately measuring, offsetting and committing to annually reduce emissions 5.55% by 2030, 2D Building Contractors Ltd is not only Carbon Neutral, but in alignment with both Science Based and UK Government targets for Carbon Emissions Reductions"

**James Poynter**  
Director - Carbon Neutral Britain

# 7.6 Intensity Ratios - FTE and Revenue

To further showcase 2D Building Contractors Ltd’s progress, it is important to consider current and historic emissions intensity ratios:

**Current emissions/FTE - 4.87 tCO2e**  
**Current emissions/£1m - 21.33 tCO2e**

Measurement via these benchmarks provides a standardised way to assess environmental performance, irrespective of changes in the organisation's size or structure.

Additionally, should the need arise for a rebaseline, these metrics provide consistency in progress over time, even when historic data may no longer be relevant to the current structure and size of the organisation.

In future reporting, 2D Building Contractors Ltd could consider setting reduction targets for its intensity ratios, in addition to net emissions.

# 7.7 Year-on-Year Emissions by Source

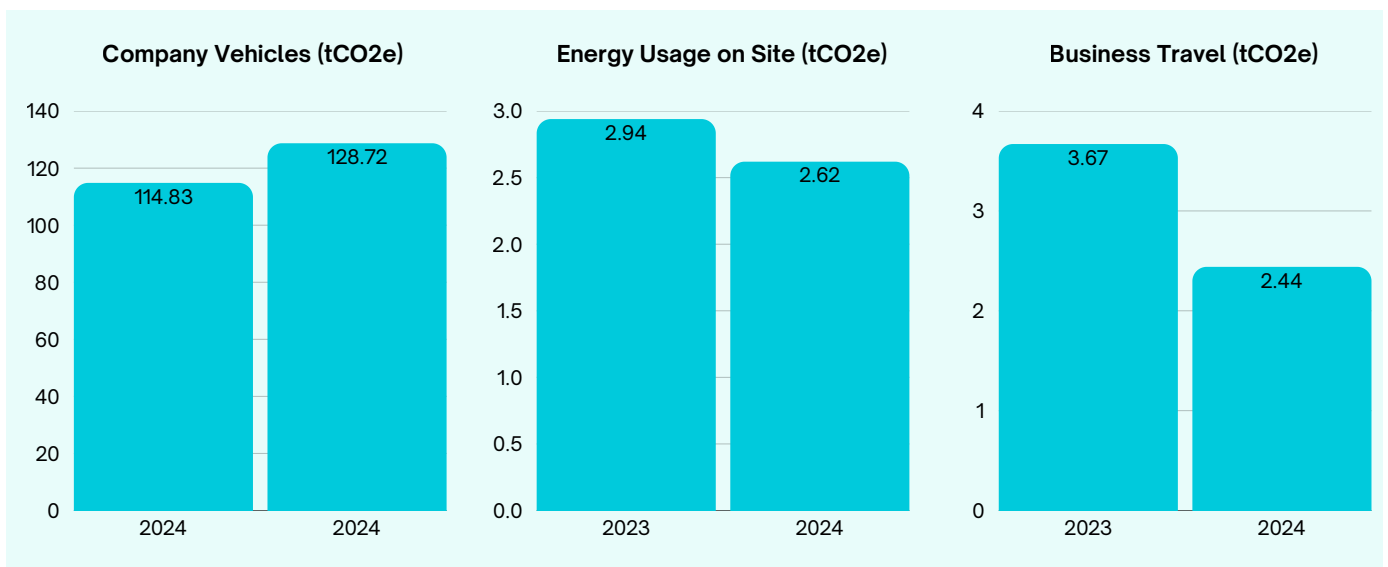

Although some emission reductions will require technological and third-party improvements, it is recommended that 2D Building Contractors Ltd targets the three largest avoidable emissions sources of the organisation in order to make the most impactful and quickest reduction in emissions possible.

Following the Baseline (first year) assessment of the organisation, 2D Building Contractors Ltd has seen a 7% increase in overall emissions in year four.

A year-on-year analysis highlights the following three largest avoidable emission sources:

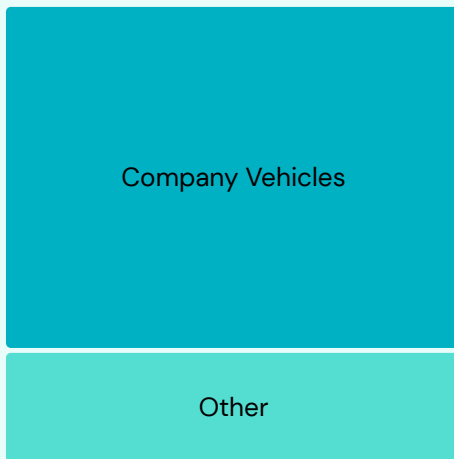

- Company Vehicles** has seen a 12% increase from 114.83 tCO<sub>2</sub>e to 128.72 tCO<sub>2</sub>e
- Energy Usage on Site** has seen a 11% decrease from 2.94 tCO<sub>2</sub>e to 2.62 tCO<sub>2</sub>e
- Business Travel** has seen a 33% decrease from 3.67 tCO<sub>2</sub>e to 2.44 tCO<sub>2</sub>e

It is recommended the organisation continues to monitor and track its emissions in 2025, to further monitor and evaluate emissions reductions, in addition to offsetting and maintaining carbon neutral status.

## 7.8 Reduction Strategies

### Company Owned/Leased Vehicles

Company-owned and leased vehicles are a large source of Scope 1 emissions for 2D Building Contractors Ltd, with an increase in mileage this year. Last year, the company fleet emitted 114.83 tCO<sub>2</sub>e, whereas this year, it emitted 128.72 tCO<sub>2</sub>e, a 12% increase. A rise in mileage has led to a corresponding increase in emissions, highlighting the potential for targeted action to manage and reduce the environmental impact of company vehicle use.

Potential opportunities for the company are:

**Fuel Efficiency and Journey Optimization:** Optimizing vehicle routes and journey planning could immediately reduce emissions. Internal guidelines could be established to ensure drivers prioritize economical routes, minimizing overall mileage. Utilizing fleet management systems could help monitor vehicle usage, identify the most efficient routes, and reduce unnecessary travel.

**Transition to Low-Emission Vehicles:** The most impactful way to address the increased emissions is by transitioning to hybrid or electric vehicles within the company fleet. 2D Building Contractors Ltd could explore available grants or funding options to support this transition. Replacing older, less efficient vehicles with electric or hybrid models could enhance fleet sustainability and reduce emissions.

## 7.8 Reduction Strategies (continued)

---

**Internal Education and Eco-Driver Training:** Providing education on eco-driving techniques and emphasizing efficient route planning could help mitigate the impact of increased mileage. Implementing training programs focused on fuel-efficient driving habits, such as reducing idle time, smooth acceleration, and maintaining consistent speeds, could lead to incremental but meaningful improvements. Staff could also be encouraged to select the shortest, most economical routes to further reduce mileage and fuel consumption.

**Relevant Schemes and Support:**

- **Plug-In Vehicle Grant:** Government incentives could help offset the costs of adopting electric vehicles, making them a more feasible option for fleet replacement.
- **Eco-Driver Training Programs:** Offering training or workshops on efficient driving techniques could equip drivers with the skills needed to operate vehicles sustainably.
- **Fleet Management Software:** Investing in technology to track vehicle performance, fuel efficiency, and route planning could provide valuable insights and help optimize fleet operations.

By targeting these areas, 2D Building Contractors Ltd could effectively manage the rising emissions from increased vehicle use.

## 7.8 Reduction Strategies (continued)

### Energy Usage on Site

During the reporting period, electricity emissions have reached a notable proportion of the business's overall emissions and highlight the opportunities of adopting strategies to reduce electricity consumption.

Reducing electricity usage is important for minimizing emissions, and it remains a key area for improvement.

Implementing energy-efficient lighting, equipment, and appliances across 2D Building Contractors Ltd's operations could lead to large reductions in electricity consumption. Additionally, adopting smart energy management systems to monitor and control usage could further optimize efficiency.

For leased sites where infrastructure changes may be limited, moving to a more energy-efficient location could be explored. Promoting hybrid working arrangements to reduce office occupancy could also help lower electricity use, as working from home typically consumes less energy compared to office environments. Downsizing office space or adopting flexible workspaces could provide additional savings in energy requirements.

By targeting these opportunities, 2D Building Contractors Ltd could effectively reduce electricity-related emissions and contribute to a more sustainable operational footprint.

## 7.8 Reduction Strategies (continued)

### Business Travel

Business travel, especially by air and personal vehicles, is a large source of emissions for 2D Building Contractors Ltd. Reducing travel-related emissions requires targeted action across car travel, flights, and train journeys.

Switching to low-emission vehicles, encouraging carpooling, and collecting data on vehicle fuel types could reduce car travel emissions.

Replacing flights with virtual meetings, choosing direct routes, and flying economy class could also cut down emissions. For train travel, leveraging digital platforms to minimize trips and exploring discounts with rail/public transport companies could further reduce emissions.

Targeting these areas will help 2D Building Contractors Ltd reduce travel emissions and promote sustainable practices.
